Fossils

By Amber

Facts about fossils

- The reason we now so much about dinosaurs is that we have fossils of them, fossils are mostly bones so the fossils gives us clues of the dinosaurs so we know what they look like even though we have never seen them in our lives.
- The fossils give all the scientists clues about animals and plants that lived a long long time ago.
- Did you know that even poop can be fossilized? Fossils of poop are called coprolites, and they can tell us what the creature it came from ate.
- Fossilised teeth, tell us which dinosaurs were carnivores (meat eaters), which were herbivores (plant eaters), and which were omnivores (ate both meat and plants).

Why do fossils crack

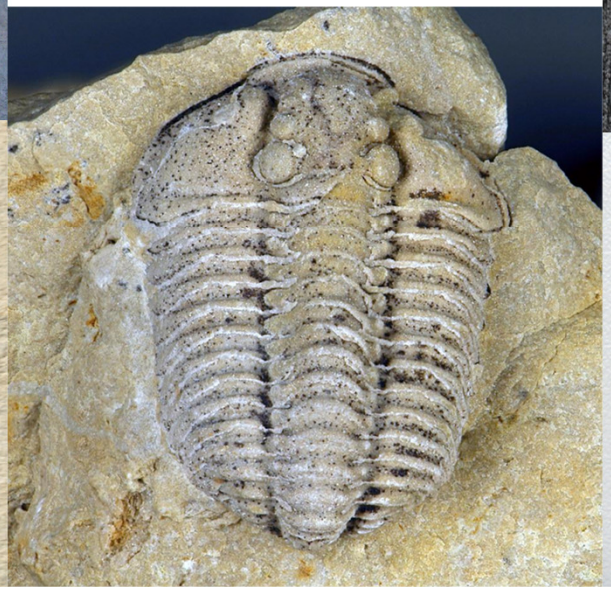

The reason fossils crack could be because the fossils are from thousands of years ago and they have got very very old over time. If you think if you were as old as the dinosaurs and you turned into a fossil many many years ago you would of turn very fragile by now and you would crack if someone wasn't gentle with you.
